

## **AMENDMENTS TO THE CLAIMS**

Please amend the claims as detailed below.

1. (Original) An electromechanical switch comprising:
  - a signal contact;
  - an actuation electrode;
  - a beam to electrically couple to the signal contact when an actuating voltage is applied to the actuation electrode; and
  - a coating to at least facilitate the existence of an arc reduction environment.
  
2. (Original) The electromechanical switch of claim 1, further comprising:
  - a cap coupled to a substrate to substantially enclose the signal contact, the actuation electrode, the beam, and the coating; and
  - the cap and the substrate cooperate to define the boundaries of the arc reduction environment.
  
3. (Original) The electromechanical switch of claim 1, wherein the coating comprises a hydride.
  
4. (Original) The electromechanical switch of claim 1, wherein the coating is disposed between the beam and at least one of a group consisting of the signal contact and the actuation electrode.
  
5. (Original) The electromechanical switch of claim 4, wherein the coating is applied to at least one of a group consisting of the actuation electrode, the signal contact, a first portion of the beam corresponding to the actuation electrode, and a second portion of the beam corresponding to the signal contact.

6. (Original) The electromechanical switch of claim 5, wherein  
the signal contact, the actuation electrode, and the beam are comprised of  
respective materials having respective coefficients of secondary electron emissions,  
and  
the coating is comprised of a material having a coefficient of secondary electron  
emission approximately lower than the coefficients of secondary electron emissions of  
the material over which it is applied.
7. (Original) The electromechanical switch of claim 6, wherein the coating includes  
titanium.
8. (Original) The electromechanical switch of claim 1, further comprising:  
a protuberance disposed on a portion of the beam corresponding to the signal  
contact.
9. (Original) The electromechanical switch of claim 8, wherein at least a portion of the  
coating is applied to the protuberance.
10. (Original) The electromechanical switch of claim 8, wherein at least a portion of the  
coating comprises the protuberance.
- 11.-17. (Canceled)
18. (Original) A system comprising:  
a bus;  
a memory coupled to the bus; and  
a circuit coupled to the bus, the circuit including an electromechanical switch  
having a signal contact, an actuation electrode, a beam to engage the signal contact  
when a voltage is applied to the actuation electrode, and a coating to facilitate the  
existence of an arc reduction environment.

19. (Original) The system of claim 18, wherein the coating comprises a hydride.

20. (Original) The system of claim 18, wherein the coating is applied to at least one of a group consisting of the actuation electrode, the signal contact, a first portion of the beam corresponding to the actuation electrode, and a second portion of the beam corresponding to the signal contact.

21. (Original) The system of claim 20, wherein

the signal contact, the actuation electrode, and the beam are comprised of respective materials having respective coefficients of secondary electron emissions; and

the coating is comprised of a material having a coefficient of secondary electron emission lower than the coefficients of secondary electron emissions of the material over which it is applied.

22. (Original) The system of claim 21, wherein the coating includes titanium.

23. (Original) The system of claim 18, wherein the circuit further includes a processor.

24. (Original) The system of claim 23, wherein the system is a selected one of a group consisting of a network router, a wireless mobile phone, and a personal digital assistant.

25. (New) A method comprising:

transmitting a signal to an input of an enclosed switch having a beam, a signal contact and an actuation electrode selectively actuatable to couple the beam to the signal contact, the enclosed switch further having a coating to reduce a likelihood of a generation of an arc within the enclosed switch; and

applying an actuating voltage to the actuation electrode to couple the beam to the signal contact.

26. (New) The method of claim 25, wherein the coating comprises a hydride and applying an actuating voltage heats the hydride coating to a point that hydrogen is released, the released hydrogen increasing a pressure within the enclosed switch.

27. (New) The method of claim 25, further comprising:

transmitting the signal to an output of the enclosed switch when the beam is coupled to the signal contact.

28. (New) The method of claim 25, wherein the coating is applied to at least one of a group consisting of the actuation electrode, the signal contact, a first portion of the beam corresponding to the actuation electrode, and a second portion of the beam corresponding to the signal contact.

29. (New) The method of claim 25, wherein

the signal contact, the actuation electrode, and the beam are comprised of respective materials having respective coefficients of secondary electron emissions; and

the coating is comprised of a material having a coefficient of secondary electron emission lower than the coefficients of secondary electron emissions of the material over which it is applied.

30. (New) The method of claim 25, wherein the coating includes titanium.
